Clinical Notes for Testing

This synthetic report intentionally contains a mixture of values within and outside the stated reference ranges so that an application can test extraction, abnormal-value detection, charts, trend comparison, and personalized insight generation. The application should not treat these values as a diagnosis.

Suggested test cases:

- Extract patient and report metadata.
- Identify fasting glucose and HbA1c as outside the stated reference ranges.
- Identify total cholesterol, LDL, triglycerides, and vitamin D as outside the stated reference ranges.

- Recognize normal CBC, liver, kidney, thyroid, and B12 results.
- Generate graphical representations of the results.
- Save the report and extracted values to patient history.
- Use this report as the baseline for comparison with a later uploaded report.
